Transitioning Cultures of Everyday Food Consumption and Production: Stories from a Post-growth Future

日々の食の消費と生産の文化を変える：ポスト成長期の未来からの物語

Whether by ecological breakdown or concerted action, the era of mass production and consumption is nearing its end. This means that the resource-intensive systems of provisioning on which many currently depend upon to meet their daily needs will change. As food is so ingrained in culture and the rhythms of daily life, the repatterning of a post-growth food system has profound implications for the future of lifestyles, work, and health. How might sustainable food practices reconstitute foodscapes of sufficiency and conviviality, in which the line between consumer and producer is blurred? How do we redesign food production around the principles of agroecology so they might regenerate ecological synergies and expand farmer and citizen sovereignty? Food futures are political—how do civic food actors rally around desirable food visions and find agency in transforming their foodsheds? Finally, can our relationship with food and agriculture redefine socio-cultural ideas of the good life and enable alternative worldviews that embrace ecological and social limits?
