

Evaluation of transition of FS to FR (PR)

Title of the Project	Hydrological cycles and water problems in the Changjiang basin: Human-nature interaction in China undergoing rapid transformation
Project Leader	TANAKA Hiroki
General advice and comments of PEC: This is a comprehensive project, emphasizing human-nature interaction; its integrative approach is impressive. PEC would like clear description of what distinguishes this project from existing and ongoing studies. In view of the difficulty of gathering data in rural China, the field methodology should be clarified. In particular, the relationship of local field studies to the Chianjiang basin-scale model should be developed. These methodological issues may be clarified through increased dialogue and collaboration with Chinese scholars and local authorities.
