

Penultimate year FR Evaluation

Title of the Project	Effects of Environmental Change on the Interactions between Pathogens and Humans
Project Leader	KAWABATA Zen'ichiro
General advice and comments of PEC: <p>This is a well-designed project since the selection of KHV as a disease is timely and meaningful and implementation of this project is crucial for wider understanding of the issue. Taking the evaluation criteria for FR4, such as academic and social contribution, into consideration, PEC strongly recommends that application of the research model should be elaborated in more detail so that the second and the third objectives explained in the executive summary would be realized. As the environment-disease relation is very important, this project is expected to be an innovative contribution to the academic society through the accomplishment of the interdisciplinary work on interactions between pathogens and humans.</p>
