

## Final Evaluation at the end of FR

<b>Title of the Project</b>	<b>Human Life, Aging and Disease in High-Altitude Environments: Physio-Medical, Ecological and Cultural Adaptation in “Highland Civilizations”</b>
<b>Project Leader</b>	<b>OKUMIYA Kiyohito</b>
<b>General advice and comments of PEC:</b> <p>This project is noteworthy for gathering extensive data on various factors of the relationship between high-altitude environment and human life, aging and diseases. Hence, it is compatible with founding missions and research of RIHN. Nevertheless, there seems to be no clarification on how these data sets and variables are integrated within the main hypothesis of this project. How you utilized the concept of “Quality of Life” during implementation and completion stages of your project needs to be better explained and presented in the following CR activities. There is a considerable amount of literature on the similar grounds with this project. For this reason, CR activities would need to focus on the significance and scientific contribution of this research to the international literature. PEC also would like to suggest that you might omit “civilizations” from the project title to present the content of the project in a more appropriate way.</p>
